# Why Multi-Factor Authentication (MFA) is a must

Multi-Factor Authentication (MFA) *adds an extra step* when you log in.

## It requires two or more pieces of proof to confirm your identity:

A code sent to your phone

+

A fingerprint or face scan

or

a security app/key

80% of hacking-related breaches happen due to weak or stolen passwords.

MFA blocks

99.9% of automated attacks.

Even if a scammer steals your password, **they can't access your account.**

Stolen credentials are the

#1 way cyber criminals access business systems.

Businesses without MFA are at higher risk of data breaches and ransomware.

MFA is quick, easy, and it protects your business.
